Preparation and application

1. Check the substrate

The background must be stable, dry, clean and compatible. Check that the previous finish has reached the condition required to receive the glaze.

2. Prepare the material

Dilute Metal Light with 30% water. Mix the water evenly into the product before working.

3. Prepare a sample

Produce a test with the specified colour, substrate and technique. Natural and artificial light change the perception of pearlescent reflections. An 8-hour wait is recommended between coats; check actual dryness before recoating.

4. Apply the finish

Work with clean tools and the chosen technique. Assess any subsequent passes against the sample effect, allowing the material to dry.

Application notes

Dilute with 30% water. On-screen colours and reflections are indicative; check the result on a physical sample.

Storage

Store in the tightly closed original container in a suitable place, protected from frost, direct sunlight and sources of heat. Reseal carefully after dispensing and follow the instructions on the label.

Safety

Read the product label and Safety Data Sheet before use. Wear the specified personal protective equipment and work with adequate ventilation. Do not release residues into the environment.
